Worksheet-2 in R

John Kenneth D. Tan

2022-10-06

Tan, John Kenneth D. BSIT 2-A

1. Create a vector using : operator

a. Sequence from -5 to 5. Write the R code and its output. Describe its output.

```
NumSeq<- c(-5:5)
NumSeq
```

```
##  [1] -5 -4 -3 -2 -1  0  1  2  3  4  5
```

A sequence from -5 to 5 is stored in the object called NumSeq and was displayed.

b. x <- 1:7. What will be the value of x?

```
x <- 1:7
x
```

```
## [1] 1 2 3 4 5 6 7
```

2. Create a vector using seq() function

a. seq(1, 3, by=0.2) #specify step size Write the R code and its output. Describe the output.

```
seq(1, 3, by=0.2)
```

```
##  [1] 1.0 1.2 1.4 1.6 1.8 2.0 2.2 2.4 2.6 2.8 3.0
```

The gap of these numbers in the sequence was 0.2.

3. A factory has a census of its workers. There are 50 workers in total. The following list shows their ages: 34, 28, 22, 36, 27, 18, 52, 39, 42, 29, 35, 31, 27, 22, 37, 34, 19, 20, 57, 49, 50, 37, 46, 25, 17, 37, 43, 53, 41, 51, 35, 24,33, 41, 53, 40, 18, 44, 38, 41, 48, 27, 39, 19, 30, 61, 54, 58, 26, 18.

```
age <- c(34, 28, 22, 36, 27, 18, 52, 39, 42, 29, 35, 31, 27, 22, 37, 34, 19, 20,
         57, 49, 50, 37, 46, 25, 17, 37, 43, 53, 41, 51, 35, 24,33, 41, 53, 40,
         18, 44, 38, 41, 48, 27, 39, 19, 30, 61, 54, 58, 26,18)
age
```

```
##  [1] 34 28 22 36 27 18 52 39 42 29 35 31 27 22 37 34 19 20 57 49 50 37 46 25 17
## [26] 37 43 53 41 51 35 24 33 41 53 40 18 44 38 41 48 27 39 19 30 61 54 58 26 18
```

a. Access 3rd element, what is the value?

```
  third_element <- c(age[3])
  third_element
```

```
## [1] 22
```

b. Access 2nd and 4th element, what are the values?

```
second_and_fourth_element <-age[c(2,4)]
second_and_fourth_element
```

```
## [1] 28 36
```

c. Access all but the 1st element is not included. Write the R code and its output.

```
all_element <- age[c(2:50)]
all_element
```

```
##  [1] 28 22 36 27 18 52 39 42 29 35 31 27 22 37 34 19 20 57 49 50 37 46 25 17 37
## [26] 43 53 41 51 35 24 33 41 53 40 18 44 38 41 48 27 39 19 30 61 54 58 26 18
```

4. *Create a vector x <- c(“first”=3, “second”=0, “third”=9). Then named the vector, names(x).

a. Print the results. Then access x[c(“first”, “third”)]. Describe the output.

```
names<- c("first"=3, "second"=0, "third"=9)
names
```

```
##  first second  third
##      3      0      9
```

```
names <-names [c("first","third")]
names
```

```
## first third
##     3     9
```

The first with the value of 3 and third with a value of 9 were accessed. Therefore the second with a value of 0 didn't displayed.

b. Write the code and its output.

```
names<- c("first"=3, "second"=0, "third"=9)
names
```

```
##  first second  third
##      3      0      9
```

```
names <-names [c("first","third")]
names
```

```
## first third
##     3     9
```

5. Create a sequence x from -3:2.

a. Modify 2nd element and change it to 0;

```
x<- c(-3:2)
x
```

```
## [1] -3 -2 -1  0  1  2
```

```
x[2] <- 0
x
```

```
## [1] -3  0 -1  0  1  2
```

Describe the output: The second element which is -2 was changed to 0

6. The following data shows the diesel fuel purchased by Mr. Cruz.

a. Create a data frame for month, price per liter (php) and purchase-quantity (liter). Write the codes.

```
Diesel_Fuel<- data.frame(
  Month = c("Price per liter (PhP)", "Purchase-quantity(Liter)"),
   Jan = c(52.50, 25),
   Feb = c(57.25, 30),
   March = c(60.00, 40),
   Apr = c(65.00, 50),
   May = c(74.25, 10),
   June = c(54.00, 45)
)
Diesel_Fuel
```

```
##                       Month  Jan   Feb March Apr   May June
## 1    Price per liter (PhP) 52.5 57.25    60  65 74.25   54
## 2 Purchase-quantity(Liter) 25.0 30.00    40  50 10.00   45
```

b. What is the average fuel expenditure of Mr. Cruz from Jan to June? Note: Use weighted.mean(liter, purchase)

```
liter<-c(52.50, 57.25, 60.00, 65.00, 74.25, 54.00)
purchase<-c(25,30,40,50,10,45)
weighted.mean(liter, purchase)
```

```
## [1] 59.2625
```

7. R has actually lots of built-in datasets. For example, the rivers data "gives the lengths (in miles) of 141 "major" rivers in North America, as compiled by the US Geological Survey".

a. Type "rivers" in your R console. Create a vector data with 7 elements, containing the number of elements (length) in rivers, their sum (sum), mean (mean), median (median), variance (var) standard deviation (sd), minimum (min) and maximum (max).

```
rivers
```

```
##   [1]  735  320  325  392  524  450 1459  135  465  600  330  336  280  315  870
##  [16]  906  202  329  290 1000  600  505 1450  840 1243  890  350  407  286  280
##  [31]  525  720  390  250  327  230  265  850  210  630  260  230  360  730  600
##  [46]  306  390  420  291  710  340  217  281  352  259  250  470  680  570  350
##  [61]  300  560  900  625  332 2348 1171 3710 2315 2533  780  280  410  460  260
##  [76]  255  431  350  760  618  338  981 1306  500  696  605  250  411 1054  735
##  [91]  233  435  490  310  460  383  375 1270  545  445 1885  380  300  380  377
## [106]  425  276  210  800  420  350  360  538 1100 1205  314  237  610  360  540
## [121] 1038  424  310  300  444  301  268  620  215  652  900  525  246  360  529
## [136]  500  720  270  430  671 1770
```

b. What are the results?

length = 141.0000 sum = 83357.0000 mean = 591.1844 median = 425.0000 variance = 243908.4086 standard deviation = 493.8708 minimum = 135.0000 maximum = 3710.0000

c. Write the code and its outputs.

```
data <- c(length(rivers), sum(rivers), mean(rivers), median(rivers), var(rivers),
          sd(rivers), min(rivers), max(rivers))
data
```

```
## [1]    141.0000  83357.0000    591.1844    425.0000 243908.4086    493.8708
## [7]    135.0000   3710.0000
```

8 a. Create vectors according to the above table. Write the codes.

```
Powerful_Celeb <- data.frame(
  Power_Ranking = c(1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14,
                    15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25),
  Celebrity_Name = c("Tom cruise", "Rolling Stone", "Oprah Winfrey", "U2", "Tiger Woods", "Steven Spiell
                     "Howard Stem", "50 cents", "Cast of the Supranos", "Dan brown", "Bruce Springteen",
                     "Paul McCartney", "Goerge Lucas", "Elton John", "David Letterman", "Phil Mickelson"
                     "Bradd Pitt", "Peter Jackson", "Dr. Phil McGraw", "Jay Lenon", "Celine Dion", "Kobe
  Pay = c(67, 90, 225, 110 , 90, 332, 302, 41, 52, 88, 55, 44, 55, 40, 233, 34, 40, 47, 75, 25, 39, 45,
)

Powerful_Celeb
```

```
##    Power_Ranking       Celebrity_Name Pay
## 1              1           Tom cruise  67
## 2              2         Rolling Stone  90
## 3              3         Oprah Winfrey 225
## 4              4                   U2 110
## 5              5          Tiger Woods  90
## 6              6     Steven Spielberg 332
## 7              7          Howard Stem 302
## 8              8             50 cents  41
## 9              9 Cast of the Supranos  52
## 10            10            Dan brown  88
## 11            11     Bruce Springteen  55
## 12            12         Donald Trump  44
## 13            13         Muhammad Ali  55
## 14            14       Paul McCartney  40
## 15            15         Goerge Lucas 233
## 16            16           Elton John  34
## 17            17      David Letterman  40
## 18            18       Phil Mickelson  47
## 19            19          J.K Rowling  75
## 20            20           Bradd Pitt  25
## 21            21        Peter Jackson  39
## 22            22      Dr. Phil McGraw  45
## 23            23            Jay Lenon  32
## 24            24          Celine Dion  40
## 25            25          Kobe Bryant  31
```

b. Modify the power ranking and pay of J.K. Rowling. Change power ranking to 15 and pay to 90. Write the codes and its output.

```
Power_Ranking <- 1:25
CelebrityName <- c("Tom Cruise", "Rolling Stones", "Oprah Winfrey", "U2",
                   "Tiger Woods", "Steven Spielberg", "Howard Stern", "50 Cent", "Cast of the sopranos"
                   "Dan Brown", "Bruce Springsteen", "Donald Trump", "Muhammad Ali", "Paul McCartney",
                   "George Lucas", "Elton John", "David Letterman", "Phil Mickelson", "J.K Rowling",
                   "Bradd Pitt", "Peter Jackson", "Dr. Phil McGraw", "Jay Lenon", "Celine Dion", "Kobe
```

```

## 25            25          Kobe Bryant  31
```

c. Interpret the data.

Powerful_Celeb is the object used to store the ranking of powerful celebrities. Through the data frame, their rankings are clearly shown vertically. Inside the object, PowerRanking, CelebrityName, and Pay are stored. After the successful display, J.K Rowling power ranking was modified to 15 and pay to change power ranking to 15 and pay to 90.
